

Automate electronic signing of UnForm printed and retrieved Archive documents

UnForm 9.0.20 adds a significant optional feature, DocuSign integration. DocuSign provides electronic signatures, legally recognized in many countries. PDF files produced by UnForm can be routed through DocuSign for signature by one or more recipients, and the signed copy returned to UnForm for internal processing and storage.

UnForm can submit PDF files to DocuSign and monitor their progress, then store the signed documents in an archive library or the file system, and can notify a program of the completed document. UnForm provides two methods of integration: the deliver command can submit a signature request as part of a print job, and the archive browser interface provides a user interface so a DocuSign-configured user can send a signature request from the document viewer.
